

## CONCLUSION

Information Retrieval is very useful for finding out more relevant files for given keywords. Due to this, user time is reduced for searching the relevant files from folders. For this, Accuracy is a very important factor. From the above observation, it can be concluded that Passive aggressive Classifier is better in terms of accuracy than SVM . Thus, Information Retrieval system is built using Passive aggressive Classifier and Page Rank algorithms will give better accuracy.

Using various information retrieval techniques discussed in the paper, helps in digging out layers of information about the keyword phrases, and the data collected from. Web sites present enormous potential content of information. In the conclusion, information retrieval can be summed up as a viable technology, application meant for discovering knowledge pertaining to the routine search activities and can prove to be a very important approach for gaining competitive advantage
